

- $\epsilon_r = 2 \text{ or } 3$
- Dielectric strength =  $30 \text{ kV/mm}$
- Resistivity of insulation =  $10^{17} \Omega/\text{cm}$
- **Drawback**:
  - Absorbs moisture
  - Max safe temp is low (about  $38^\circ\text{C}$ )
  - Soft & liable to damage
  - Ages when exposed to light

## ② Vulcanised India Rubber (VIR):

- pure rubber mixed with mineral such as zinc oxide, red lead etc & 3-5% of sulphur
- The compound is rolled into thin sheets & cut into strips
- Applied to conductor, heated at  $150^\circ\text{C}$
- Process is known vulcanisation

- **Advantages**:
  - $\uparrow$  mechanical strength
  - $\uparrow$  durability
  - $\uparrow$  resistant property

- **Drawback** - Sulphur reacts very quickly with copper
  - Hence its used for tinned copper conductors
- Used for low or moderate voltage levels

## ③ Impregnated paper:

- Chemically pulped paper from wood chipping & impregnated with compound like

- Advantages (i) Low cost
- (ii)  $\uparrow$  High dielectric strength.
- (iii)  $\uparrow$  insulation resistance
- Disadvantage : (i) Paper is hygroscopic
- (ii)  $\downarrow$  Insulation  $(R)$

#### ④ Varnished Cambric :

- Cotton cloth, impregnated, coated with varnish.
- Also known as empire tape.
- lapped on conductor & coated with petroleum jelly compound

disadvantage - Hygroscopic.

- Dielectric strength is 4 kv/mm
- $\epsilon_r = 2.5 - 2.8$

#### ⑤ Polyvinyl Chloride (PVC) :

- obtained from polymerisation of acetylene, & is in the form of white powder.

- Advantages : -  $\uparrow$  Insulation Resistance
- $\uparrow$  Dielectric strength
- $\uparrow$  Mechanical toughness

\* Module 5

Insulation Resistance of single core cable.

→ Consider a single core cable of conductor radius  $r_1$  and sheath radius  $r_2$ .

length  $l$  & insulation material resistivity ' $\rho$ '.

→ length through which the leakage ' $I$ ' will flow is  $dr$  & area of cross-section is  $2\pi r l$

→  $R_{ins} = \rho \frac{dr}{2\pi r l}$

→  $R_{ins} \text{ (of entire cable)} = \int_{r_1}^{r_2} \rho \frac{dr}{2\pi r l}$

$= \frac{\rho l}{2\pi l} [\log_e r]_{r_1}^{r_2}$

$= \frac{\rho l}{2\pi l} (\log_e r_2 - \log_e r_1)$

$= \frac{\rho}{2\pi l} \log_e \frac{r_2}{r_1}$

→  $R_{ins}$  varies inversely as the length of the cable.

Area of a cylinder  
 $= 2\pi r^2 + 2\pi r l$

$= (2\pi r^2 + 2\pi r l) -$

$(2\pi r^2 + 2\pi r l)$

$= 2\pi (r^2 + r l) -$

$2\pi (r^2 + r l)$

$= 2\pi [r^2 + r l] -$

$2\pi [r^2 + r l]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

$= 2\pi [r^2 - r^2 + l(r - r)]$

\* Capacitance

→ The capacitance of a cable is given by

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

$C = \frac{Q}{V}$

Capacitance of a single core cable:

The cable can be considered as two co-axial cylinders of inner diameter  $d$  & outer diameter  $D$ .  
 $d \rightarrow$  represents diameter of core  
 $D \rightarrow$  represents diameter of lead sheath at ground potential.

$\rightarrow$  Let the charge/cm length on the outer surface of core be  $+q$  coulombs.

& the charge/cm length on the inner surface of the lead sheath be  $-q$  coulombs.

$\rightarrow$  Consider a co-axial cylinder of radius  $x$  meters & of length  $l$  m.

The surface area would be  $= 2\pi r l$   
 $= 2\pi x(l) \text{ m}^2$

$$\frac{+l(r^2 - r^1)}{r+l}$$

$\rightarrow$  Electric field intensity at a point  $x$  meters from the centre of inner cylinder

$$E_r = \frac{q}{2\pi \epsilon_0 \epsilon_r x} \text{ V/m}$$

$\rightarrow$  Potential difference between capacitor plates (between core & the sheath).

$$V = \int_{D/2}^{d/2} \frac{q}{2\pi \epsilon_0 \epsilon_r x} dx = \frac{q}{2\pi \epsilon_0 \epsilon_r} \log_e \frac{D}{d} = \log_e \frac{D}{d} - \log_e \frac{d}{D}$$

$$= \frac{Q}{2\pi l \epsilon_0 \epsilon_r} \log_e \frac{D_2}{d_1} = \frac{Q}{2\pi l \epsilon_0 \epsilon_r} \log_e \frac{D}{d}$$

$$\rightarrow \text{Capacitance of cable} = \frac{Q}{V} = \frac{Q}{\frac{Q}{2\pi l \epsilon_0 \epsilon_r} \log_e \frac{D}{d}} = \frac{2\pi l \epsilon_0 \epsilon_r}{\log_e \frac{D}{d}} \text{ F/m}$$

### \* Grading of Cables

- It has been observed that the electrostatic stress is max near the surface of the conductor & goes on reducing as we move away from the cable.
- The process of achieving uniformity in dielectric stress is known as grading of cables.

#### (i) Capacitance grading:

- In this method, the uniformity in dielectric stress is achieved by using various layers of diff dielectrics in such a manner that  $\epsilon_r$  is inversely proportional to  $r$  i.e. the distance from center

$$\frac{\epsilon_r \propto 1}{r} \quad \text{or} \quad \epsilon_r r = \text{constant} \propto \frac{Q}{2\pi l \epsilon_0}$$

- Consider a cable with 3 layers of dielectric of outer diameters  $d_1, d_2$ , and  $D$ . & the relative permittivity  $\epsilon_{r1}, \epsilon_{r2}, \epsilon_{r3}$  have been used.

$$\rightarrow \epsilon_{r1} > \epsilon_{r2} > \epsilon_{r3}$$

$$\rightarrow \epsilon_{r1} d_1^2 = \epsilon_{r2} d_2^2 = \epsilon_{r3} = d_2^2 / 2 =$$

→ For the pd across the inner layer we have;

$$V_1 = \int_{d/2}^{d/2} g \, dx = \int_{d/2}^{d/2} \frac{Q}{2\pi l \epsilon_0 \epsilon_{r1} x} \, dx$$

$$= \frac{Q}{2\pi l \epsilon_0 \epsilon_{r1}} (\log_e d/2 - \log_e d/2)$$

$$= \frac{Q}{2\pi l \epsilon_0} \frac{d}{2} \log_e \frac{d_1}{d}$$

$$= g_{\max} \frac{d}{2} \log_e \frac{d_1}{d}$$

$$V_2 = g_{\max} \frac{d_1}{2} \log_e \frac{d_2}{d_1}$$

$$V_3 = g_{\max} \frac{D}{2} \log_e \frac{D}{d_2}$$

→ P.d between core & earthed sheath.

$$V = V_1 + V_2 + V_3$$

$$= \frac{q_{\max}}{2} \left[ \frac{d}{2} \log_e \frac{d_1}{d} + \frac{d_1}{2} \log_e \frac{d_2}{d_1} + \frac{d_2}{2} \log_e \frac{D}{d_2} \right]$$

(ii) Intersheath grading:

→ A homogenous dielectric is used, divided into various layers by placing metallic intersheaths.

→ These metallic intersheaths are held at certain potentials which are in between the inner core potential & the earth potential.

→ There is thus a definite potential difference between the inner & outer layers of each sheath so that each sheath can be treated like a homogenous single core cable. we have,

$$q_1 \max = \frac{V_1}{\frac{d}{2} \log_e \frac{d_1}{d}}$$

$$q_2 \max = \frac{V_2}{\frac{d_1}{2} \log_e \frac{d_2}{d_1}}$$

$$q_3 \max = \frac{V_3}{\frac{d_2}{2} \log_e \frac{D}{d_2}}$$

→ For homogenous dielectric we have;

$$q_1 \max = q_2 \max = q_3 \max = q_{\max} \text{ (say)}$$

$$\rightarrow \therefore V = V_1 + V_2 + V_3$$

$$\begin{aligned}
 v_1 &= \int_{d/2}^{d/2} \frac{Q}{2\pi\epsilon_0 r} dx = \int_{d/2}^{d/2} \frac{Q}{2\pi\epsilon_0 r} \cdot \frac{1}{x} dx \\
 &= \frac{Q}{2\pi\epsilon_0 r} \left[ \log_e x \right]_{d/2}^{d/2} \\
 &= \frac{Q}{2\pi\epsilon_0 r} \left( \log_e \frac{d}{2} - \log_e \frac{d}{2} \right) \\
 &= \frac{Q}{2\pi\epsilon_0 r} \cdot \log_e \frac{d}{d} \\
 &= \frac{Q}{2\pi\epsilon_0 \cdot 2} \cdot \log_e \frac{d}{d} \\
 &= q \max \frac{d}{2} \log_e \frac{d}{d}
 \end{aligned}$$
