- ◉ Oil companies frequently use eigenvalue analysis to explore land for oil
- ◉ Google search is an eigen value problem

# EIGEN VALUE AND EIGENVECTOR

Def. Let  $A$  be an  $n \times n$  matrix. A scalar  $\lambda$  is called an eigen value of  $A$  if there exists a nonzero  $n \times 1$  vector  $x$  such that  $Ax = \lambda x$

- Method to find eigen vectors and eigen values of any square matrix  $A$   
We know that,
- $AX = \lambda X$   
 $\Rightarrow AX - \lambda X = 0$   
 $\Rightarrow (A - \lambda I) X = 0 \dots\dots(1)$
- Above condition will be true only if  $(A - \lambda I)$  is singular. That means,  $|A - \lambda I| = 0 \dots\dots(2)$
- (2) is known as characteristic equation of the matrix.

## CONTINUED..

- The roots of the characteristic equation are the eigen values of the matrix A.
- Now, to find the eigen vectors, we simply put each eigen value into (1) and solve it by Gaussian elimination, that is, convert the augmented matrix  $(A - \lambda I) = 0$  to row echelon form and solve the linear system of equations thus obtained.

# SOME IMPORTANT PROPERTIES OF EIGEN VALUES

- ◉ Eigen values of real symmetric and hermitian matrices are real
- ◉ Eigen values of real skew symmetric and skew hermitian matrices are either pure imaginary or zero
- ◉ Eigen values of unitary and orthogonal matrices are of unit modulus  $|\lambda| = 1$
- ◉ If  $\lambda_1, \lambda_2, \dots, \lambda_n$  are the eigen values of  $A$ , then  $k\lambda_1, k\lambda_2, \dots, k\lambda_n$  are eigen values of  $kA$
- ◉ If  $\lambda_1, \lambda_2, \dots, \lambda_n$  are the eigen values of  $A$ , then  $1/\lambda_1, 1/\lambda_2, \dots, 1/\lambda_n$  are eigen values of  $A^{-1}$
- ◉ If  $\lambda_1, \lambda_2, \dots, \lambda_n$  are the eigen values of  $A$ , then  $\lambda_1^k, \lambda_2^k, \dots, \lambda_n^k$  are eigen values of  $A^k$
- ◉ Eigen values of  $A =$  Eigen Values of  $A^T$  (Transpose)
- ◉ Sum of Eigen Values = Trace of  $A$  (Sum of diagonal elements of  $A$ )

# DETERMINANT

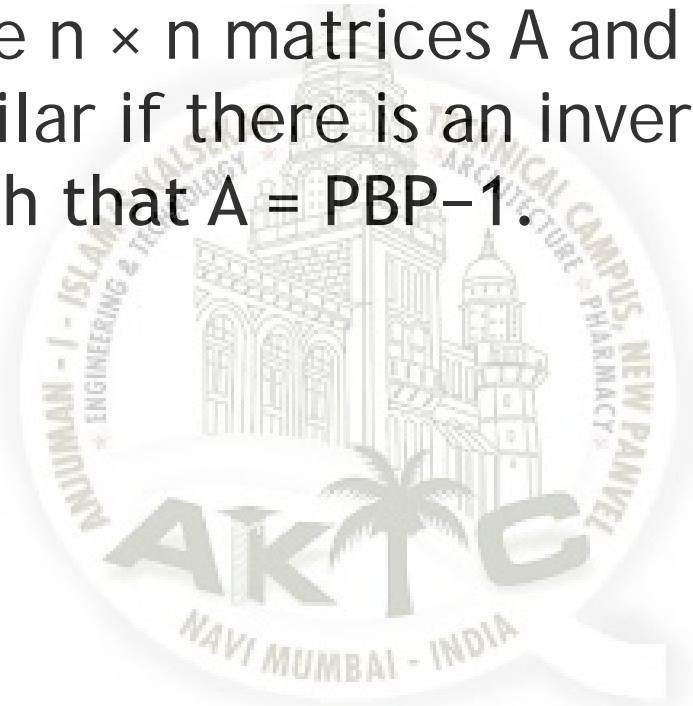

- The determinant of the  $2 \times 2$  matrix  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$  is  
 $\det A = ad - bc.$

- The determinant of the  $3 \times 3$  matrix  $A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$  is

$$\det A = a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32} - a_{31}a_{22}a_{13} - a_{32}a_{23}a_{11} - a_{33}a_{21}a_{12}.$$

# SIMILAR MATRICES

- Definition: The  $n \times n$  matrices  $A$  and  $B$  are said to be similar if there is an invertible  $n \times n$  matrix  $P$  such that  $A = PBP^{-1}$ .

# DIAGONALIZATION

- A square matrix  $A$  is said to be diagonalizable if it is similar to a diagonal matrix.
- i.e. a diagonal matrix  $A$  has the property that there exists an invertible matrix  $P$  and a diagonal matrix  $D$  such that  $A = PDP^{-1}$ .
- If  $A = PDP^{-1}$ , then  $A^k = PD^kP^{-1}$ .

# ALGEBRAIC MULTIPLICITY & GEOMETRIC MULTIPLICITY

- Let  $A$  be an  $n \times n$  matrix with eigen value  $\lambda$ . The algebraic multiplicity of  $\lambda$  is the number of times  $\lambda$  is repeated as a root of the characteristic polynomial.
- Let  $A$  be an  $n \times n$  matrix with eigen value  $\lambda$ . The geometric multiplicity of  $\lambda$  is the dimension of the eigenspace of  $\lambda$ .
