Acknowledgements

I would like to take the opportunity to express my sincere thanks to my guide **Prof. Javed Shaikh**, Assistant Professor, Department of Computer Engineering, AIKTC, School of Engineering, Panvel for his invaluable support and guidance throughout my project research work. Without his kind guidance & support this was not possible.

I am grateful to him/her for his timely feedback which helped me track and schedule the process effectively. His/her time, ideas and encouragement that he gave is help me to complete my project efficiently.

We would like to express deepest appreciation towards **DR. ABDUL RAZAK HONNUTAGI**, Director, AIKTC, Navi Mumbai, **Prof. TABREZ KHAN**, Head of Department of Computer Engineering and **Prof. JAVED SHAIKH**, Project Coordinator whose invaluable guidance supported us in completing this project.

At last we must express our sincere heartfelt gratitude to all the staff members of Computer Engineering Department who helped me directly or indirectly during this course of work.

ABSTRACT

We analyse existing and new methods of stock market prediction. We take three different approaches at the problem: Fundamental analysis, Technical Analysis, and the application of Machine Learning. We find evidence in support of the weak form of the Efficient Market Hypothesis, that the historic price does not contain useful information but out of sample data may be predictive. We show that Fundamental Analysis and Machine Learning could be used to guide an investor's decisions. We demonstrate a common flaw in Technical Analysis methodology and show that it produces limited useful information.

In the finance world stock trading is one of the most important activities. Stock market prediction is an act of trying to determine the future value of a stock or other financial instrument traded on a financial exchange. The technical and fundamental or the time series analysis is used by the most of the stockbrokers while making the stock predictions. The programming language used to predict the stock market using machine learning is Python. In our project we propose a Machine Learning (ML) approach that will be trained from the available stocks data and gain intelligence and then uses the acquired knowledge for an accurate prediction. In this context study uses a machine learning technique called Support Vector Machine (SVM) or Long Short-Term-Memory (LSTM) to predict stock prices.

Chapter 1

Introduction

Predicting the Stock Market has been the bane and goal of investors since its existence. Everyday billions of dollars are traded on the exchange, and behind each dollar is an investor hoping to profit in one way or another. Entire companies rise and fall daily based on the behaviour of the market. Should an investor be able to accurately predict market movements, it offers a tantalizing promises of wealth and influence. It is no wonder then that the Stock Market and its associated challenges find their way into the public imagination every time it misbehaves. The 2008 financial crisis was no different, as evidenced by the flood of films and documentaries based on the crash. If there was a common theme among those productions, it was that few people knew how the market worked or reacted. Perhaps a better understanding of stock market prediction might help in the case of similar events in the future.

1.1 Purpose

The title of our project is Stock Market Prediction, it is an online model to predict the stock prices of company. This project concerned about developing an online model that will be used for investors to invest smartly.

The stock market is basically an aggregation of various bPredicting the Stock Market has been the bane and goal of investors since its existence.

Everyday billions of dollars are traded on the exchange, and behind each dollar is an investor hoping to profit in one way or another.

Entire companies rise and fall daily based on the behaviour of the market.

Should an investor be able to accurately predict market movements, it offers a tantalizing promises of wealth and influence.

It is no wonder then that the Stock Market and its associated challenges find their way into the public imagination every time it misbehaves.

The 2008 financial crisis was no different, as evidenced by the flood of films and documentaries based on the crash.

If there was a common theme among those productions, it was that few people knew

how the market worked or reacted.

Perhaps a better understanding of stock market prediction might help in the case of similar events in the future. Buyers and sellers of stock.

A stock (also known as shares more commonly) in general represents ownership claims on business by a particular individual or a group of people.

To determine the future value of the stock market is known as a stock market prediction.

The prediction is expected to be robust, accurate and efficient.

The system must work according to the real-life scenarios and should be well suited to real.

1.2 Project Scope

The goal of this project is to predict a stock price of a company according to its previous historical data. Stock Market Prediction is composed of main components: a company's historical data of stock which will help to analyse the current and previous changes of stock price. The above proposed model is easy to implement considering the available technology infrastructure. The model is simple, secure and scalable. The proposed model is based on serial communication. These model will help the investors to invest their money according to the predicted value, investor's may have less chances of loss and a very huge chance of making more profit.[2]

1.3 Project Goals and Objectives

1.3.1 Goals

Despite its prevalence, Stock Market prediction remains a secretive and empirical art. Few people, if any, are willing to share what successful strategies they have. A chief goal of this project is to add to the academic understanding of stock market prediction. The hope is that with a greater understanding of how the market moves, investors will be better equipped to prevent another financial crisis. The project will evaluate some existing strategies from a rigorous scientific perspective and provide a quantitative evaluation of new strategies.

1.3.2 Objectives

1. Financial:

Many people are interested in the financial market. And need guidance and accurate predictions to invest wisely. Investors are always looking for the accurate future results. Template sample paragraph.

2.Applications and News Channels:

There are many applications that try to predict the stocks but they do not give detailed information about the prediction. Thus with a successful model for stock prediction , we try to gain insight about market behavior over time , spotting trends that would otherwise not have been noticed.

The objective of this project is to show how machine learning can help improve the future prediction of Stocks.

Chapter 2

Literature Survey

2.1 Paper Title 1: Stock Market Prediction Using Machine Learning Algorithms K. Hiba Sadia, Aditya Sharma, Adarsh Paul, Sarmistha Padhi, Saurav Sanyal

The main objective of this paper is to find the best model to predict the value of the stock market. During the process Of considering various techniques and variables that must be taken into account, we found out that techniques like random forest, support vector machine were not exploited fully. In, this paper we are going to present and review a more feasible method to predict the stock movement with higher accuracy. The first thing we have taken into account is the dataset of the stock market prices from previous year. The dataset was pre-processed and tuned up for real analysis. Hence, our paper will also focus on data preprocessing of the raw dataset. Secondly, after preprocessing the data, we will review the use of random forest, support vector machine on the dataset and the outcomes it generates

2.1.1 Advantages of Paper

- a. We are able to train the machine from the various data points from the past to make a future prediction.
- b. The basic approach of the supervised learning model is to learn the patterns and relationships in the data from the training set and then reproduce them for the test data.
- c. The tuned up dataframe allowed us to prepare the data for feature extraction.

2.1.2 Disadvantages of Paper

- a. The existing system fails when there are rare outcomes or predictors, as the algorithm is based on bootstrap sampling.
- b. The existence system reported highly predictive values, by selecting an appropriate time period for their experiment to obtain highly predictive scores.

- c. It doesn't focus on external events in the environment, like news events or social media.

2.1.3 How to overcome the problems mentioned in Paper

1. The input datasets will first be processed through the basic algorithms and the outputs from these algorithms will be fed to the meta-learner.
2. The meta-learner will perform the task of optimizing the outputs of the algorithms.
3. It itself is another more powerful algorithm which will improve the overall efficiency of the system.
4. The meta-learner upon analysing all the outputs will produce the final prediction for the consumer.

2.2 Paper Title 2 : Stock Market Prediction using Machine Learning Prof. S .P. Pimpalkar, Jenish Karia , Muskaan Khan, Satyam Anand, Tushar Mukherjee

The core motive of this project is to analyse the market and predict its performance using various machine learning techniques. The predictive architecture will use various attributes as the input and will predict whether the market value will be Positive or Negative. The various attributes that are used in the model include Oil rates, Foreign Exchange Rate, Interest rate, Gold and Silver rates, NEWS, twitter news feed and Pattern Matching. The different ML techniques including Support Vector Machine with regression (SVR) and Recurrent Neural Network are used. The algorithm SVR produced the most efficient results among all.

2.2.1 Advantages of Paper

- a. The meta-learner will perform the task of optimizing the outputs of the algorithms.
- b. It itself is another more powerful algorithm which will improve the overall efficiency of the system.

2.2.2 Disadvantages of Paper

- a. Accuracy would decrease when setting more levels of stock market movement.
- b. These results indicate that the stock price is unpredictable when traditional classifier is used.

2.2.3 How to overcome the problems mentioned in Paper

- a. The input datasets will first be processed through the basic algorithms and the outputs from these algorithms will be fed to the meta-learner.
- b. The meta-learner will perform the task of optimizing the outputs of the algorithms.
- c. It itself is another more powerful algorithm which will improve the overall efficiency of the system.
- d. The meta-learner upon analysing all the outputs will produce the final prediction for the consumer.

2.3 Paper Title 3: Automated Stock Price Prediction Using Machine Learning Mariam Moukalled Wassim El-Hajj Mohamad Jaber

We propose an automated trading system that integrates mathematical functions, machine learning, and other external factors such as new's sentiments for the purpose of achieving better stock prediction accuracy and issuing profitable trades. Particularly, we aim to determine the price or the trend of a certain stock for the coming end-of-day considering the first several trading hours of the day.

2.3.1 Advantages of Paper

- a. Identified the best time interval for stock price prediction.
- b. Identified the best news scenario and that each stock is affected differently by news.
- c. ITEM 3

2.3.2 Disadvantages of Paper

- a. The existence system reported highly predictive values, by selecting an appropriate time period for their experiment to obtain highly predictive scores.
- b. It can predict the stock value of one company at a time.

2.3.3 How to overcome the problems mentioned in Paper

- a. The main component of this system is the financial news articles collected from yahoo finance and represented as noun phrases; all the collected noun phrases are represented as vector of binary values indicating the presence or absence of a phrase in the article.
- b. The second main component of this system is the stock price data collected in one minute time frame.
- c. Then, the final major task after collecting the data and formalizing the inputs was building and training the AI model.

2.4 Technical Review

learning tools represent key enablers for empowering material scientists and engineers to accelerate the development of novel materials, processes and techniques. One of the aims of using such approaches in the field of materials science is to achieve high-throughput identification and quantification of essential features along the process-structure-property-performance chain. In this contribution, machine learning and statistical learning approaches are reviewed in terms of their successful application to specific problems in the field of continuum materials mechanics. They are categorized with respect to their type of task designated to be either descriptive, predictive or prescriptive; thus to ultimately achieve identification, prediction or even optimization of essential characteristics. The respective choice of the most appropriate machine learning approach highly depends on the specific use-case, type of material, kind of data involved, spatial and temporal scales, formats, and desired knowledge gain as well as affordable computational costs.

2.4.1 Advantages of Technology

- a. Machine Learning can review large volumes of data and discover specific trends and patterns that would not be apparent to humans.
- b. With ML, you don't need to babysit your project every step of the way. Since it means giving machines the ability to learn, it lets them make predictions and also improve the algorithms on their own.

2.4.2 Reasons to use this Technology

- a. To identify important insights in data, and prevent fraud.
- b. Finding new energy sources. Analyzing minerals in the ground. Predicting refinery sensor failure. Streamlining oil distribution to make it more efficient and cost-effective.

Chapter 3

Project Planning

3.1 Members and Capabilities

Table 3.1: Table of Capabilities

SR. No	Name of Member	Capabilities
1	Raafil Deshmukh	Database, UI Design
2	Huzefa Surme	Back end, documnetation
3	Shaikh Tanveer ALam	Back end, documentation

Work Breakdown Structure

- a. All of the members are equally important in developing the project.
- b. We work on a different part of the project based on one's capability
- c. Firstly we came up with documentation, And based on the documentation we set our goal and created a blueprint.
- d. We then started going hands-on with the project to develop it according to the flow as decided earlier

3.2 Roles and Responsibilities

Table 3.2: Table of Responsibilities

SR. No	Name of Member	Role	Responsibilities
1	Raafil Deshmukh	Team Leader	UI Design
2	Huzefa Surme	Member	Back End
3	Shaikh Tanveer Alam	Member	Back End

3.3 Assumptions and Constraints

- a. Stock analysis is a process followed by traders to evaluate and understand the value of a security or the stock market.
- b. Stock analysis follows the idea that analysts can create methodologies to select stocks by studying past and present data.
- c. Generally predictions of stocks helps stock agents to verify the stock prices.
- d. User of this software will help him to buy the particular software at their best time.

3.4 Project Management Approach

- a. Planning of project
- b. Defining the scope of the project.
- c. Estimation of time and It's management.
- d. Creating Gantt Charts and properly assigning tasks to members
- e. Reporting the progress of project with the guide.

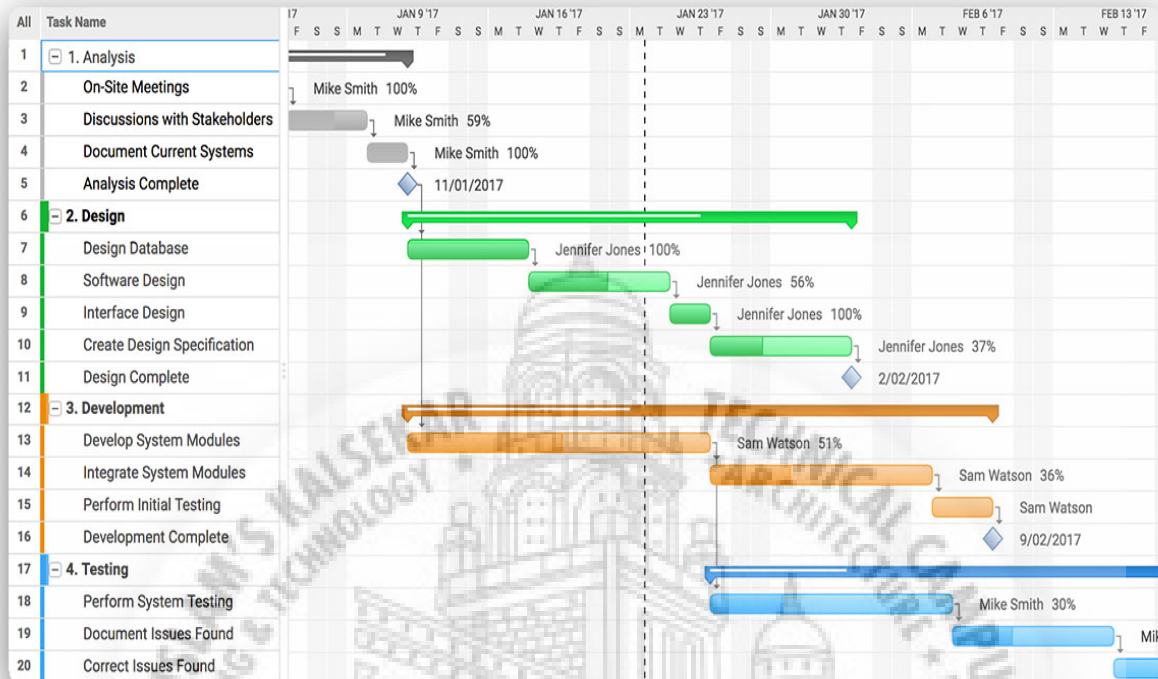

3.5 Ground Rules for the Project

- a. Properly planning and gathering relevant information is very important.
- b. Developing a Blueprint of the project and work accordingly.
- c. All the members should report to the guide whenever required
- d. Setting up small goals every week.
- e. Achieving the small goal within that span of time.
- f. Keeping tracks of the progress towards project.

3.6 Project Budget

- a. It is moderate project with high end technology.
- b. Cost of the project is low and efficient.
- c. Time-consuming as it is on latest technologies.

3.7 Project Timeline

Chapter 4

Software Requirements Specification

4.1 Overall Description

4.1.1 Product Perspective

The stock market is basically an aggregation of various buyers and sellers of stock. A stock (also known as shares more commonly) in general represents ownership claims on business by a particular individual or a group of people. The attempt to determine the future value of the stock market is known as a stock market prediction. The prediction is expected to be robust, accurate and efficient. The system will be working according to the real-life scenarios and should be well suited to real-world settings. The system is also expected to take into account all the variables that might affect the stock's value and performance. There are various methods and ways of implementing the prediction system like Fundamental Analysis, Technical Analysis, Machine Learning, Market Mimicry, and Time series aspect structuring. With the advancement of the digital era, the prediction has moved up into the technological realm. The most prominent and promising technique involves the use of Artificial Neural Networks, Recurrent Neural Networks, that is basically the implementation of machine learning. slope of linear model applied on tick data of the respective hour, which gives an idea about the trend during the last hour

4.1.2 Product Features

- a. Maximum price received during the selected hour.
- b. Minimum price received during the selected hour.
- c. Average price received during the selected hour.
- d. Standard deviation of prices received during the selected hour
- e. logarithmic difference between average prices of two consecutive hours.

- f. slope of linear model applied on tick data of the respective hour, which gives an idea about the trend during the last hour

4.1.3 User Classes and Characteristics

This project is a share market software. This can be used by normal people as well as by agents to identify the market high and low prices depend on the company they want to lookout. It is a good software for beginner to identify the market value as per its choice.

4.1.4 Operating Environment

- a. Jupyter Notebook
- b. Python 3.0
- c. LSTM
- d. Pandas
- e. Datasets

4.1.5 Design and Implementation Constraints

This system focuses one of the features at time. It is not able to provide two or more services at a time. At any instant only one of the services is accessible

4.2 System Features

It is used to predict the stock price based on the company which we choose to be predicted. Using the previous data the software is used to predict the future prediction of a selected company. Data is converted into graph to let us know what will be high and low price the stock can go for the particular day, month or year.

4.2.1 System Feature

Using the text data to get converted into graph form to easily identify the predicted stock of a company.

Description and Priority

Well it is the most important feature in our prediction software.

This helps in extraction of text from the background.

Our software read the previous data and do some operations with the data to identify the predicted price of a company stock.

Stimulus/Response Sequences

Stimulus: User choose the particular company stock. Responses: Software uses the training testing results to identify the further process. Responses: After testing training the data algorithm is used to predict the data.

Functional Requirements

REQ-1: Covertion Of Text Data to Graph.

REQ-2: Training Testing the data.

4.2.2 User Interfaces

User Interface Design focuses on anticipating what users might need to do and ensuring that the interface has elements that are easy to access, understand, and use to facilitate those actions.

4.2.3 Hardware Interfaces

Depending on executing the system our hardware should be well maintained and able to execute the program in a well upgraded hardware.

4.2.4 Software Interfaces

LSTM models are powerful, especially for retaining a long-term memory, by design. In a pure machine learning interest. In my opinion, the model has observed certain patterns in the data, thus giving it the ability to correctly predict the stock movements most of the time.

4.3 Nonfunctional Requirements

4.3.1 Performance Requirements

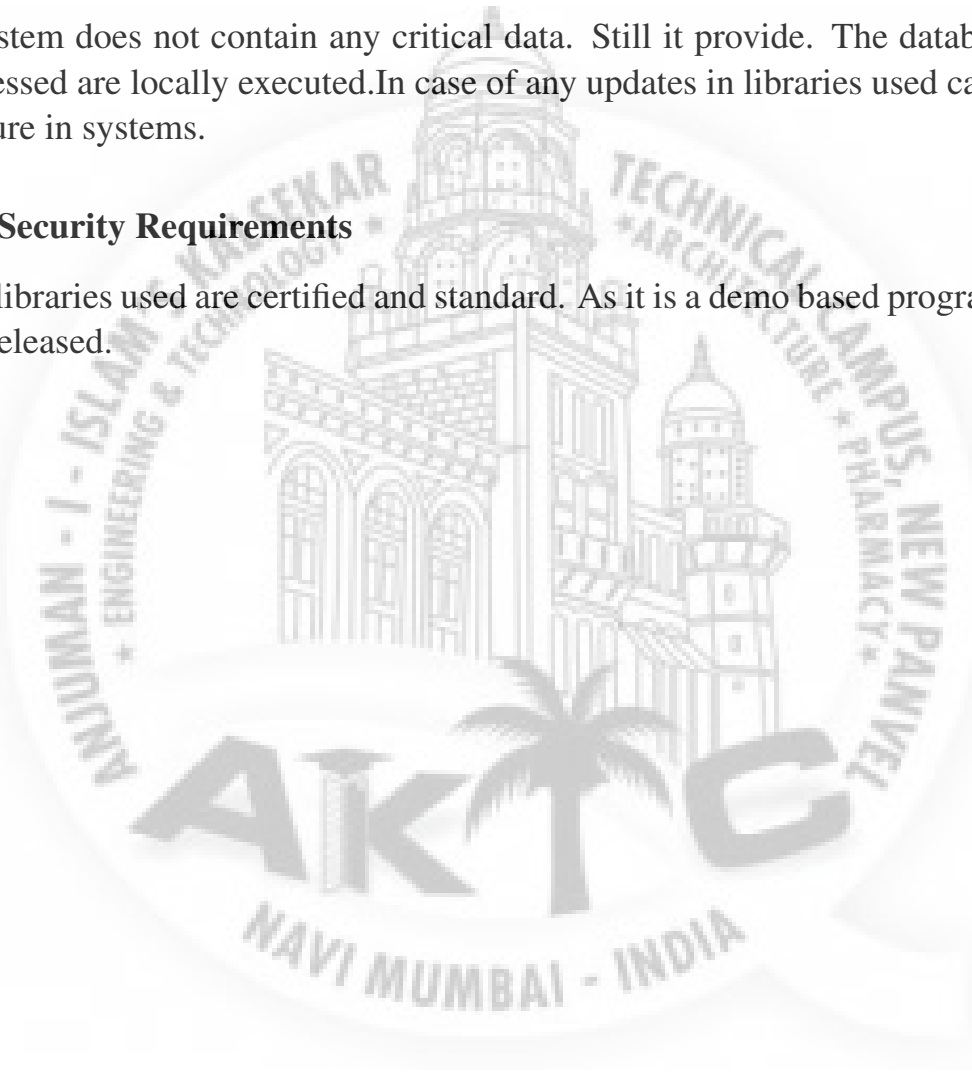

Performance of overall system is very efficient and well optimize. From the time taken to capture and process it everything is well organized. While processing the stock price it will take time depending on the hardware we will be executing this on.

4.3.2 Safety Requirements

This system does not contain any critical data. Still it provide. The databases that are accessed are locally executed. In case of any updates in libraries used can lead to the failure in systems.

4.3.3 Security Requirements

All the libraries used are certified and standard. As it is a demo based program .After that is released.

Chapter 5

System Design

5.1 System Requirements Definition

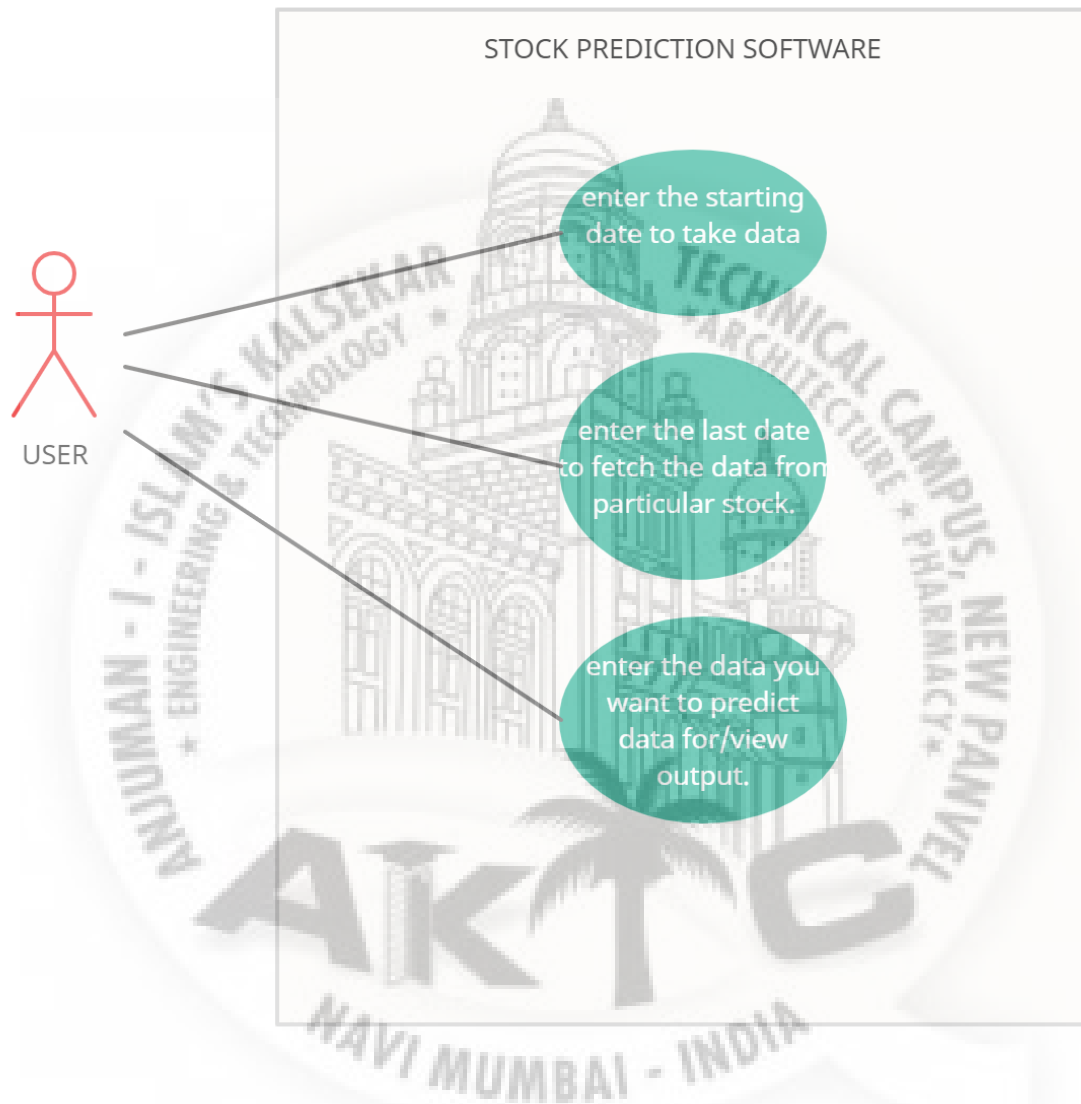

System requirement definitions specify [1] what the system should do, its functionality and its essential and desirable system properties. The techniques applied to elicit and collect information in order to create system specifications and requirement definitions involve consultations, interviews, requirements workshop with customers and end users. The objective of the requirements definition phase is to derive the two types of requirement:

5.1.1 Functional requirements

They define the basic functions that the system must provide and focus on the needs and goals of the end users.

Use-case Diagram

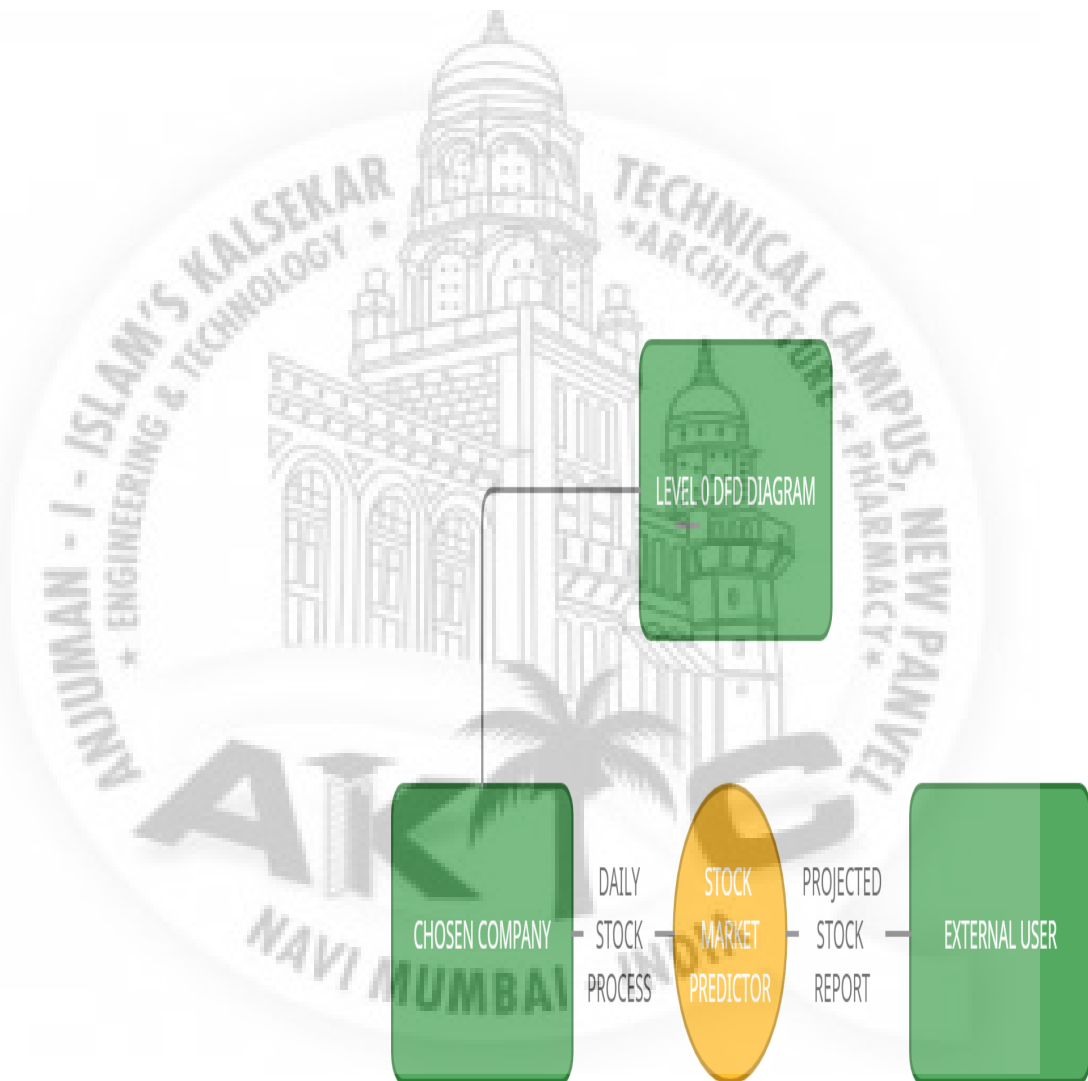

A use case diagram at its simplest is a representation of a user's interaction with the system that shows the relationship between the user and the different use cases in which the user is involved. In our system User will interact with use cases like Capture Image, Audio Input, Save text, Retrieve Text, Audio output.

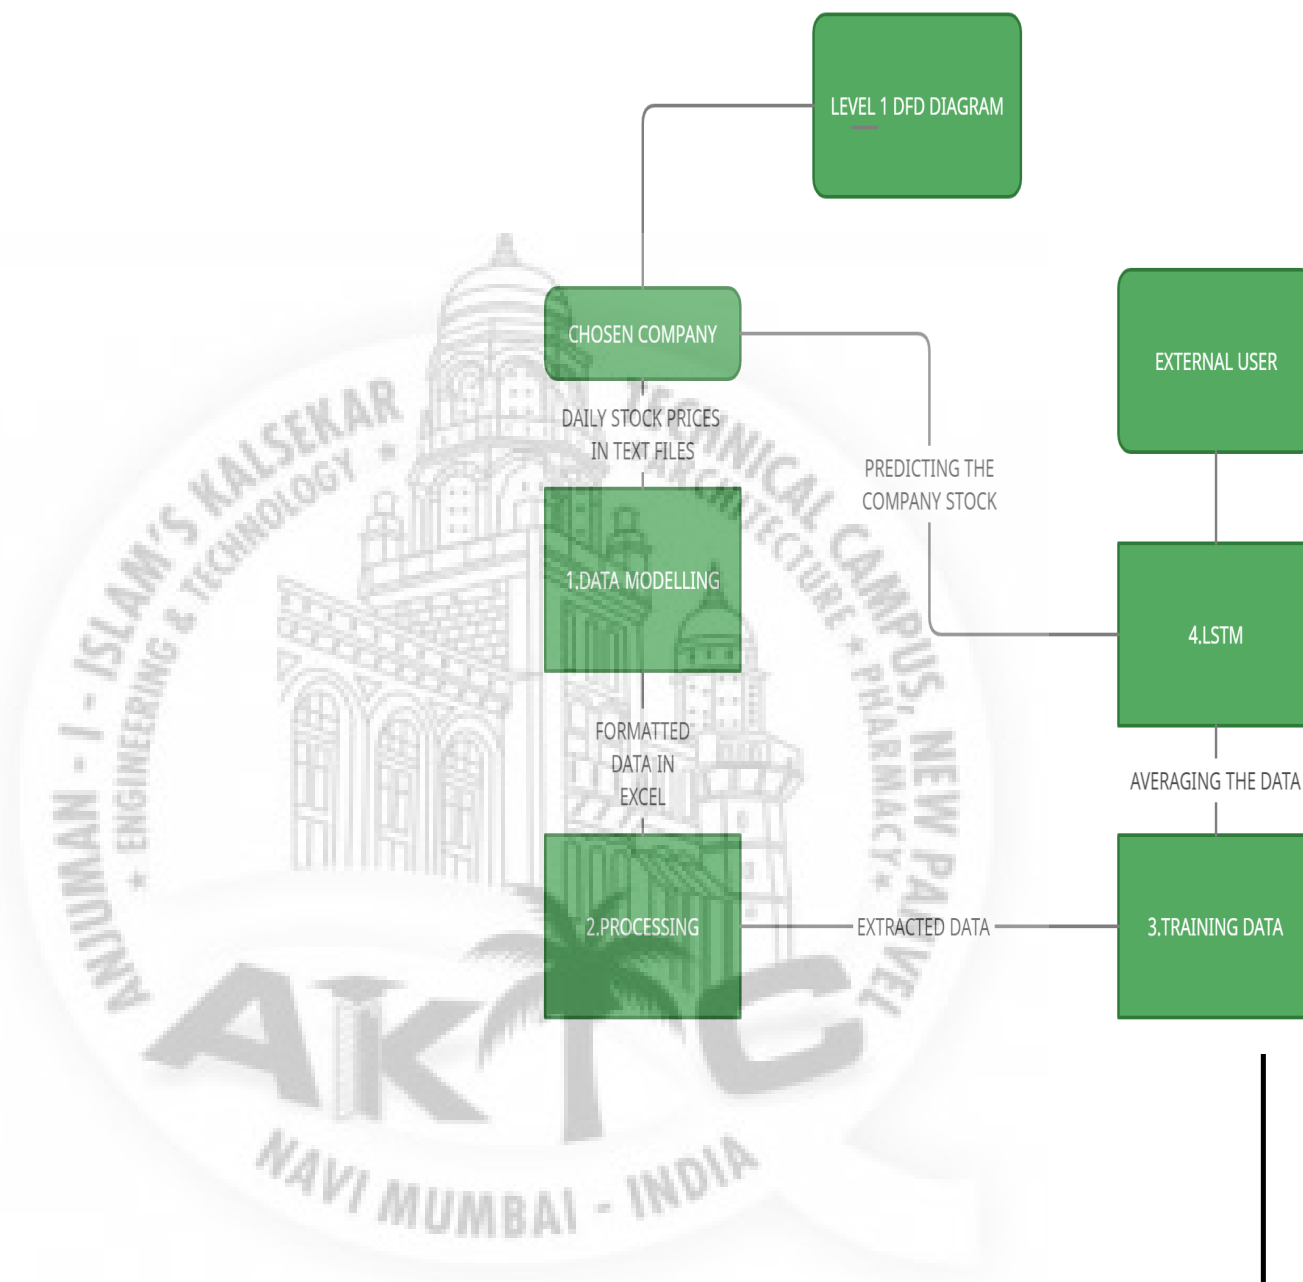

Data-flow Diagram

A data-flow diagram is a way of representing a flow of a data of a process or a system. The DFD also provides information about the outputs and inputs of each entity and the process itself. Given below is Level 0 Level 1 and Level 2 DFD of system.

—

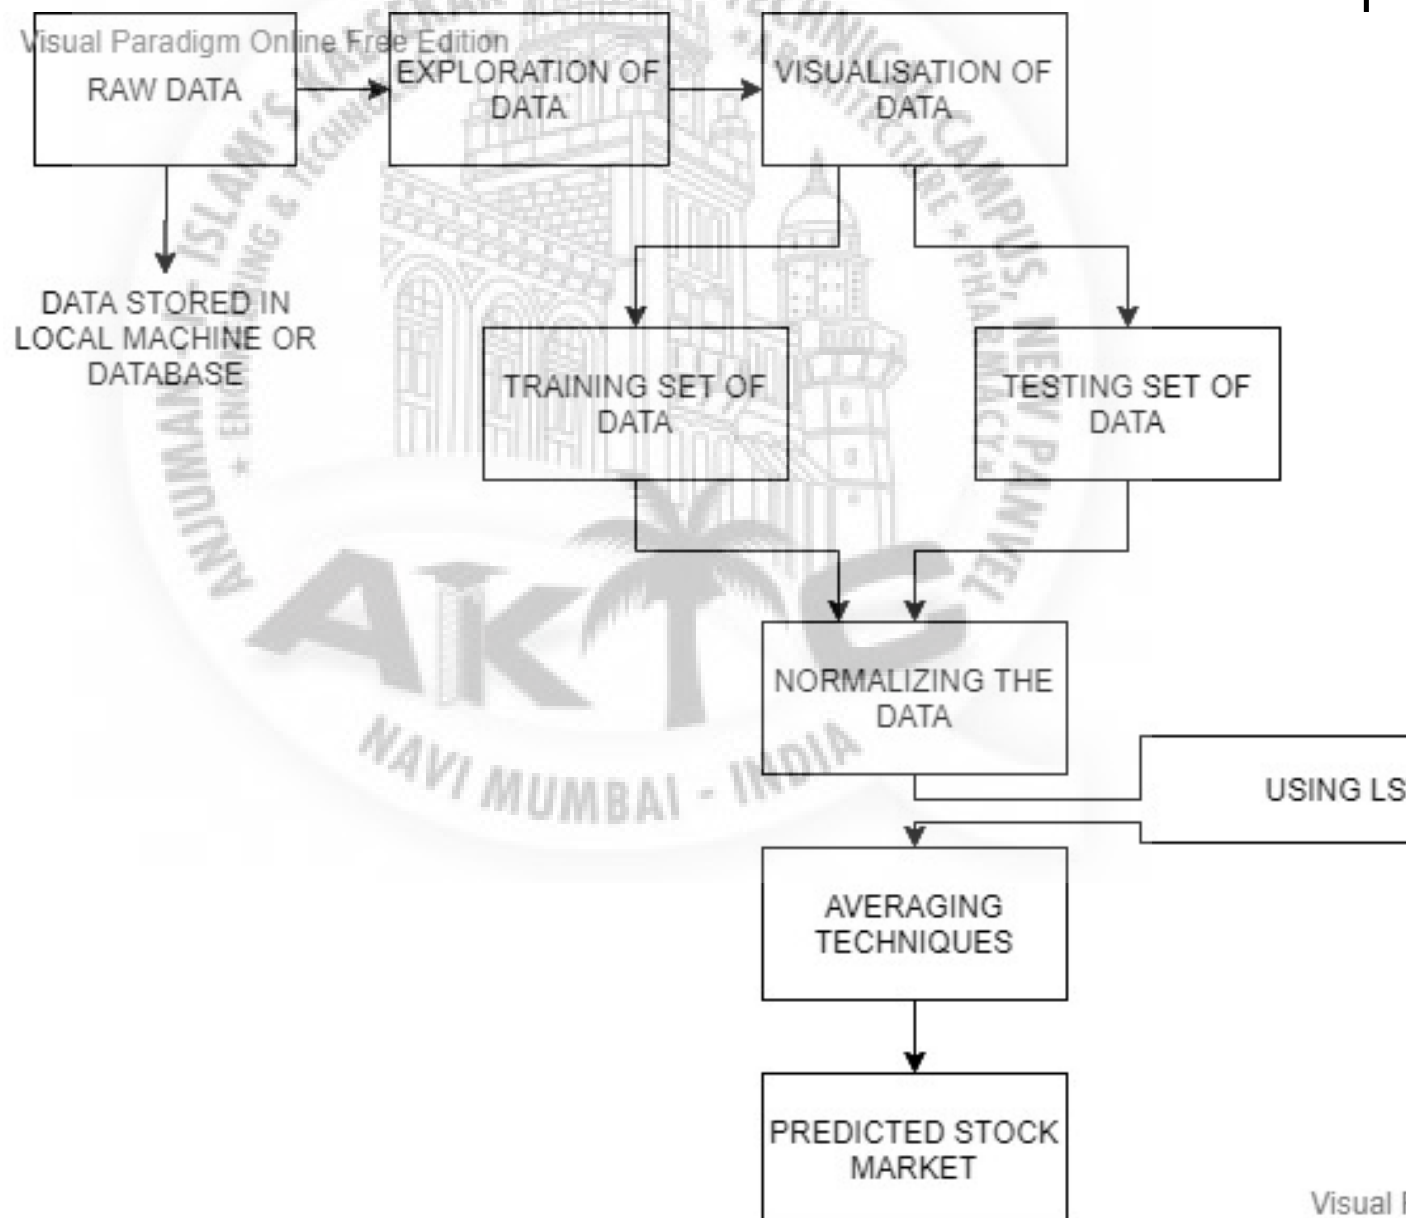

5.1.2 System requirements (non-functional requirements)

These are non-functional system properties such as availability, performance and safety etc. They define functions of a system, services and operational constraints in detail.

5.2 System Architecture Design

A system architecture is the conceptual model that defines the structure, behavior, and more views of a system. An architecture description is a formal description and representation of a system, organized in a way that supports reasoning about the structures and behaviors of the system.

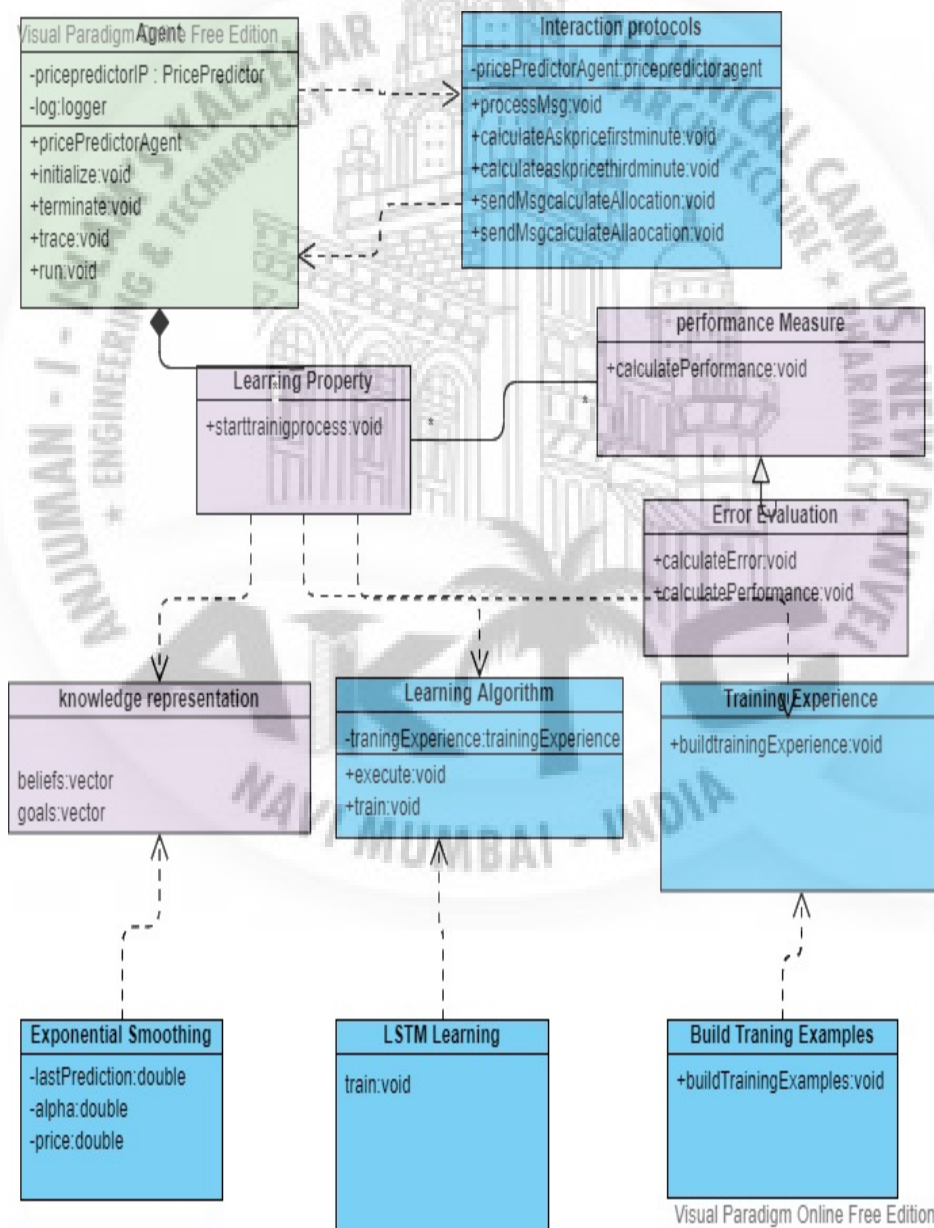

5.3 Systems Integration

System integration (SI) is an engineering process or phase concerned with joining different subsystems or components as one large system. It ensures that each integrated subsystem functions as required. SI is also used to add value to a system through new functionalities provided by connecting functions of different systems

5.3.1 Class Diagram

In software engineering, a class diagram in the Unified Modeling Language is a type of static structure diagram that describes the structure of a system by showing the system's classes, their attributes, operations, and the relationships among objects.

Chapter 6

Implementation

6.1 Setting Up Data Set

Deep learning is involved a lot in the modern quantitative financial field. There are many different neural networks can be applied to stock price prediction problems. The recurrent neural network, to be specific, the Long Short Term Memory(LSTM) network outperforms others architecture since it can take advantage of predicting time series (or sequentially) involved result with a specific configuration.

```
1 import numpy as np
2 import matplotlib.pyplot as plt
3 import pandas as pd
4
5 dataset_train = pd.read_csv('Google_Stock_Price_Train.csv')
6
7 training_set = dataset_train.iloc[:,1:2].values # data frame created. To make it
8         numpy array(as they are the only mode of input in Keras), we add values ()
9
10 # feature scaling begins
11 from sklearn.preprocessing import MinMaxScaler
12 sc = MinMaxScaler(feature_range = (0,1))
13 # it is recommended to keep the original training set
14 training_set_scaled = sc.fit_transform(training_set)
15
16
17
18
19
20 X_train = []
21 y_train = []
22
23 for i in range(60, 1258):
24     X_train.append(training_set_scaled[i-60:i, 0]) # hence we get the stock
25         prices from day 0 to day 59 (prev 60). Output y_train will have the
26         stock price of day 60, as the RNN will learn to predict.
27     y_train.append(training_set_scaled[i, 0])
28     # X_train and y_train are list..so we have to convert them in numpy array
29 X_train , y_train = np.array(X_train), np.array(y_train)
```

```

30 X_train = np.reshape(X_train, (X_train.shape[0], X_train.shape[1], 1)) # 1 for
    open google stock price
31
32 # Designing a stacked LSTM without dropout regularization
33 from keras.models import Sequential
34 from keras.layers import Dense
35 from keras.layers import LSTM
36 from keras.layers import Dropout
37 regressor = Sequential() # initializes the RNN
38 # adding layer 1 and dropout regularization
39 # LSTM(<number of cells>, <return sequences = True ; as we are building a
    stacked model>, <input shape = shape of the input in X_train>)
40 regressor.add(LSTM(units = 50, return_sequences = True, input_shape = (X_train.
    shape[1],1) )) # we will add an object of LSTM class
41 regressor.add(Dropout(0.2))
42 # adding new layers of LSTM with dropout regularization
43 regressor.add(LSTM(units = 50, return_sequences = True)) # we will add an object
    of LSTM class
44 regressor.add(Dropout(0.2))
45 regressor.add(LSTM(units = 50, return_sequences = True)) # we will add an object
    of LSTM class
46 regressor.add(Dropout(0.2))
47 regressor.add(LSTM(units = 50, return_sequences = False)) # we will add an
    object of LSTM class
48 regressor.add(Dropout(0.2))
49
50 # adding the output layer
51 # the output layer is fully connected to the output layer
52 regressor.add(Dense(units = 1))
53 # compiling
54 regressor.compile(optimizer = 'adam', loss = 'mean_squared_error')
55 # training
56 regressor.fit(X_train, y_train, epochs = 100, batch_size = 32 )
57
58 # save
59 from keras.models import model_from_json
60 model_json = regressor.to_json()
61 with open("model.json", "w") as json_file:
62     json_file.write(model_json)
63 regressor.save_weights("model.h5")
64 print("Saved model to disk")
65
66 # get model
67 from keras.models import model_from_json
68 json_file = open('model.json', 'r')
69 loaded_model_json = json_file.read()
70 json_file.close()
71 loaded_model = model_from_json(loaded_model_json)
72 loaded_model.load_weights("model.h5")
73 print("Loaded model from disk")
74 loaded_model.compile(loss='mean_squared_error', optimizer='adam')
75 # loading over
76
77 # test set
78 dataset_test = pd.read_csv('Google_Stock_Price_Test.csv')
79 real_stock_price = dataset_test.iloc[:,1:2].values
80 dataset_total = pd.concat((dataset_train['Open'], dataset_test['Open']), axis =
    0)
81 # at each day of financial day, we need the prices of prev 60 days
82 inputs = dataset_total[len(dataset_total) - len(dataset_test) - 60: ].values
83 inputs = inputs.reshape(-1,1)

```

```
84 inputs = sc.transform(inputs)
85 X_test = []
86 for i in range(60,80):
87     X_test.append(inputs[i-60:i, 0])
88 X_test = np.array(X_test)
89 X_test = np.reshape(X_test, (X_test.shape[0], X_test.shape[1], 1))
90 predicted_stock_price = loaded_model.predict(X_test)
91 # inverse the scaling on the prediction
92 predicted_stock_price = sc.inverse_transform(predicted_stock_price)
93
94 # visualizing the result
95 plt.plot(real_stock_price, color = 'red', label = 'Real Google Stock price')
96 plt.plot(predicted_stock_price, color = 'blue', label = 'Predicted Google Stock
97 price')
97 plt.title('Google Stock Price Prediction')
98 plt.xlabel('Time')
99 plt.ylabel('Google Stock Price')
100 plt.legend()
101 plt.show()
```

6.2 TRAINING AND TESTING DATA

. It will be beneficial to normalize your training data before you feed data into your model. "Having different features with widely different scales fed to your model will cause the network to weight the features not equally. This can cause a falsely prioritisation of some features over the others in the representation.

```
1 # Creating a data structure with and 1 output
2 X_train = []
3 y_train = []
4
5 for i in range(60, 1258):
6     X_train.append(training_set_scaled[i-60:i, 0]) # hence we get the stock
7         prices from day 0 to day 59 (prev 60). Output y_train will have the
8         stock price of day 60, as the RNN will learn to predict.
9     y_train.append(training_set_scaled[i, 0])
10    # X_train and y_train are list..so we have to convert them in numpy array
11 X_train, y_train = np.array(X_train), np.array(y_train)
12
13 X_train = np.reshape(X_train, (X_train.shape[0], X_train.shape[1], 1)) # 1 for
14 open google stock price
```

6.3 Visualisation Of Result

Here we will use keras to smoothly interact for building our :STM networks.

```
1 plt.plot(real_stock_price , color = 'red', label = 'Real Google Stock price')
2 plt.plot(predicted_stock_price , color = 'blue', label = 'Predicted Google Stock
  price')
3 plt.title('Google Stock Price Prediction')
4 plt.xlabel('Time')
5 plt.ylabel('Google Stock Price')
6 plt.legend()
7 plt.show()
```

6.4 Adding Layers of LSTM

```
1 from keras.models import Sequential
2 from keras.layers import Dense
3 from keras.layers import LSTM
4 from keras.layers import Dropout
5 regressor = Sequential() # initializes the RNN
6
7 regressor.add(LSTM(units = 50, return_sequences = True, input_shape = (X_train.
8     shape[1],1) )) # we will add an object of LSTM class
9 regressor.add(Dropout(0.2))
10 regressor.add(LSTM(units = 50, return_sequences = True))
11 regressor.add(Dropout(0.2))
12 regressor.add(LSTM(units = 50, return_sequences = True))
13 regressor.add(Dropout(0.2))
14 regressor.add(LSTM(units = 50, return_sequences = False))
15 regressor.add(Dropout(0.2))
```

6.5 Expected Results of graphs

Here we will be displaying our graph on our Website.

```
1 ratio = -1
2   it = 0
3   dt = 0
4   n = len(predicted_stock_price)
5   for i in range(n):
6       for j in range(i + 1, n):
7           if ((predicted_stock_price[j] / predicted_stock_price[i]) > ratio):
8               ratio = predicted_stock_price[j] / predicted_stock_price[i]
9               it = i
10              dt = j
11 ratio=int(ratio*10000)
12 site = Main.objects.get(pk=2)
13 showstock = Stock.objects.filter(name=word)
14 return render(request, 'front/stock_detail.html', {'site': site, 'showstock':
    : showstock, 'df':df, 'ratio':ratio, 'it':it, 'dt':dt})
```

Chapter 7

System Testing

System testing is a level of software testing where a complete and integrated software is tested. The purpose of this test is to evaluate the system's compliance with the specified requirements

7.1 Test Cases and Test Results

Test ID	Test Case Title	Test Condition	System Behavior	Expected Result
T01	choose company	company chosen	analysing database	company selected
T02	select open and close date	dates to get selected	analysing database	dates selected
T03	prediction result	analysing result	analysing database	graph prediction

7.2 Sample of a Test Case

Title: Predicted Result – User enters a particular company stock.

Description: A user should be able to successfully able to collect information regarding the company stock.

Assumption: A user is handy to use the software.

Test Steps:

1. Navigate to our Stock website
2. In the 'company stock' field, enter the company name of for which you want to buy the stock.
3. Click the 'Next' button.

4. Enter the open and close date of the company which you want
5. Click predict.

Expected Result: A page displaying the graphical image of the predicted result should load, showing any new message at the top of the page.

Actual Result: Graph with predicted result is being displayed.

Write here description
upload the image of result

7.2.1 Software Quality Attributes

Availability-1 : The system shall be available to users all the time.

Availability-2 : The system shall always have something to function and always pop up error messages in case of component failure.

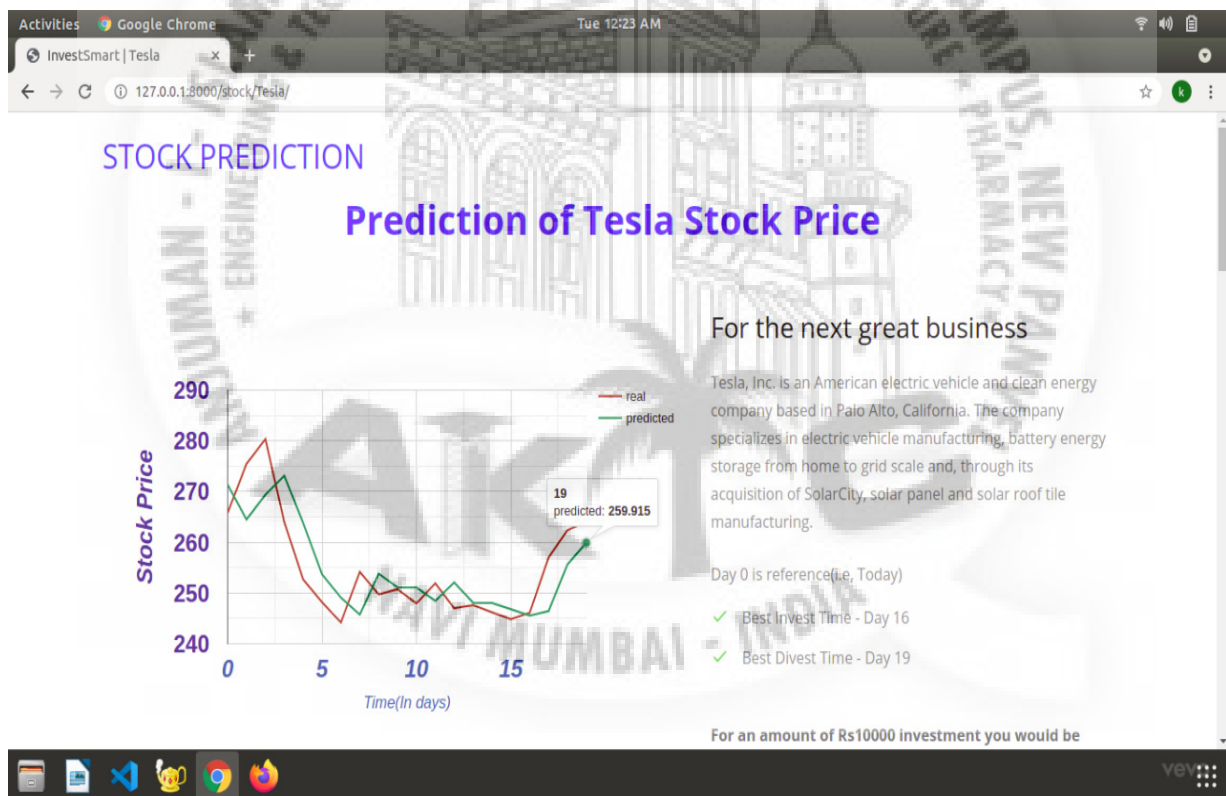

Efficiency-1 : The system shall generate the predicted price with an accuracy.

Efficiency-2 : The system shall provide the right tools to support all its features.

STOCK PREDICTION

Prediction of Google Stock Price

For the next great business

Google LLC is an American multinational technology company that specializes in Internet-related services and products, which include online advertising technologies, a search engine, cloud computing, software, and hardware. It is considered one of the Big Four technology companies alongside Amazon, Apple, and Facebook. Together they own about 14 percent of its shares and control 56 percent of the stockholder voting power through supervoting stock. They incorporated Google as a California privately held company on September 4, 1998, in California.

Chapter 9

Conclusion and Future Scope

9.1 Conclusion

By measuring the accuracy of the different algorithms, we found that the most suitable algorithm for predicting the market price of a stock based on various data points from the historical data is the LSTM .

The algorithm will be a great asset for brokers and investors for investing money in the stock market since it is trained on a huge collection of historical data and has been chosen after being tested on a sample data. The project demonstrates the machine learning model to predict the stock value with more accuracy as compared to previously implemented machine learning models.

9.2 Future Scope

Future scope of this project will involve adding more parameters and factors like the financial ratios, multiple instances, etc. The more the parameters are taken into account more will be the accuracy. The algorithms can also be applied for analyzing the contents of public comments and thus determine patterns/relationships between the customer and the corporate employee. The use of traditional algorithms and data mining techniques can also help predict the corporations performance structure as a whole.

- Adding up whole company stocks.
- Designing a system to buy and sell the particular stocks.
- Providing agent services for new customers to help them in investing their stocks.
